Decipherment

Kevin Knight
Information Sciences Institute
University of Southern California

includes joint work with:
S. Ravi (USC/ISI, now Google)**, Q. Dou, K. Yamada** (USC/ISI)
B. Megyesi, C. Schaefer (Uppsala Univ.)
R. Barzilay, B. Snyder (MIT)
S. Reddy (Univ. Chicago, now Dartmouth)

ACL Tutorial August 2013

Why Decipherment?

- It's fun and cool
  - ancient languages
  - secret societies
- Breaking codes was the first application of NLP
- Intellectual root of NLP
  - language models, log-odds ratios, smoothing
  - ASR and MT use "decoders"
- View foreign language as a code for English

Decipherment Papers by ACL-ers

- "Unsupervised Analysis for Decipherment Problems," (K. Knight, A. Nair, N. Rathod, and K. Yamada), Proc. ACL-COLING, 2006. (Rejected four times previously, but OK!)

- "Attacking Decipherment Problems Optimally with Low-Order N-gram Models," (S. Ravi and K. Knight), *Cryptologia*, 2009.
- "Probabilistic Methods for a Japanese Syllable Cipher," (S. Ravi and K. Knight), Proc. ICCPOL, 2009.

- "A Statistical Model for Lost Language Decipherment," (B. Snyder, R. Barzilay, and K. Knight), Proc. ACL, 2010.
- "An Exact A* Method for Deciphering Letter-Substitution Ciphers," (E. Corlett and G. Penn), Proc. ACL, 2010.

- "Deciphering Foreign Language," (S. Ravi and K. Knight), Proc. ACL, 2011.
- "The Copiale Cipher," (K. Knight, B. Megyesi, and C. Schaefer), Proc. ACL BUCC, 2011.
- "Bayesian Inference for Zodiac and Other Homophonic Ciphers," (S. Ravi and K. Knight), Proc. ACL, 2011.
- "What We Know About the Voynich Manuscript," (S. Reddy and K. Knight), Proc. ACL LaTECH, 2011.
- "Simple Effective Decipherment via Combinatorial Optimization," (T. Berg-Kirkpatrick and D. Klein), Proc. EMNLP, 2011.

- "Decoding Running Key Ciphers," (S. Reddy and K. Knight), Proc. ACL, 2012.
- "Large Scale Decipherment for Out-of-Domain Machine Translation," (Q. Dou and K. Knight), Proc. EMNLP, 2012.
- "Deciphering Foreign Language by Combining Language Models and Context Vectors," (M. Nuhn, A. Mauser, and H. Ney), Proc. ACL, 2012.

- "Decipherment Complexity in 1:1 Substitution Ciphers," (M. Nuhn, and H. Ney), Proc. ACL, 2013.
- "Beam Search for Solving Substitution Ciphers," (M. Nuhn, J. Schamper, and H. Ney), Proc. ACL, 2013.
- "Scalable decipherment for machine translation via hash sampling," (S. Ravi), Proc. ACL, 2013.
- "Unsupervised Consonant-Vowel Prediction over Hundreds of Languages," (Y. Kim and B. Snyder), Proc. ACL, 2013.

Outline

- Classical military/diplomatic ciphers (15 mins)
- Foreign language as a code (10 mins)
- Automatic decipherment (55 mins)
- **Break** **(30 mins)**
- Unsolved ciphers (40 mins)
- Writing as a code for speech (20 mins)
- Undeciphered writing systems (15 mins)
- Conclusions (15 mins)

Classical military/diplomatic ciphers

Letter Substitution Cipher

- Encipherment key:

```
PLAIN:    ABCDEFGHIJKLMNOPQRSTUVWXYZ
CIPHER:   PLOKMIJNUHBYGVTFCRDXESZAQW
```

- Plaintext: **HELLO WORLD ...**
- Ciphertext: **NMYYT ZTRYK ...**

- Key itself doesn't change: "simple substitution"
- What key, if applied to the ciphertext, would yield sensible plaintext?

```

Fundamental Questions

- How much English does a system need to know to break a cipher?
- How long does the cipher need to be, to admit a unique solution?
- How much computational effort is required to decipher?

and…

How to Make Things Harder?

- Homophonic cipher
  - ciphertext values from 00 to 99
    - A → 02, 14, 16, 22, 49, 51, 58, 90
    - B → 04, 76
    - C → 15, 56, 71

      etc
  - flattens out ciphertext distribution
    - "a cab…" becomes "22 56 14 04…"
  - still deterministic in the deciphering direction

or perhaps:

A = 
B = 

C = 
D = 
E = 

F = 

G = …

- Polyalphabetic ciphers
  - the secret key changes at each plaintext letter token
  - e.g., rotate through 10 different keys

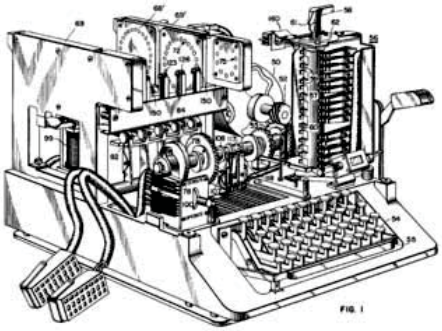
- Transposition ciphers

Cipher Types

- http://cryptogram.org/cipher_types.html
  - documents ~70 types
- E.g., RUNNING KEY cipher
  - key = agreed-upon standard English text
  - ciphertext(i) = [plaintext(i) + key(i)] mod 26
  - effectively uses 26 substitution keys
  - breakable!
  - we search for a key and (resulting) plaintext that are both natural language

How to Make Things Efficient?

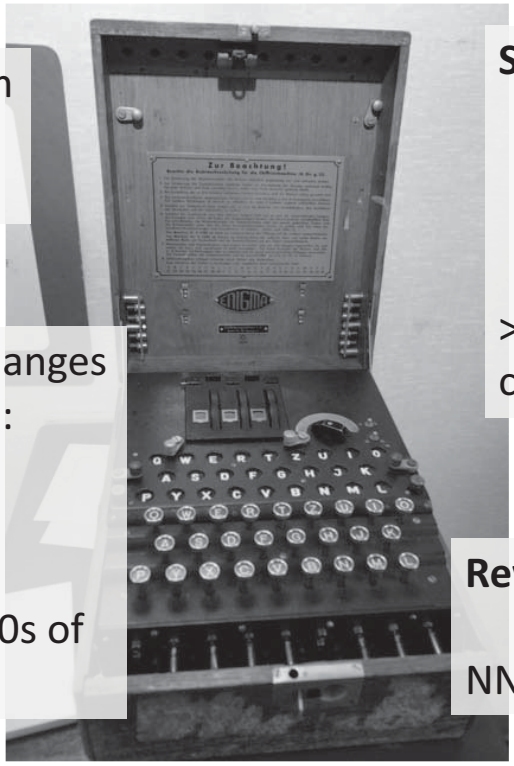
- Mechanical encryption/decryption devices



German Enigma Machines (1926-45)

Substitution system

N → J



Secret key = initial rotor ordering and settings

>Billions of initial configurations.

Substitution table changes with every keystroke:

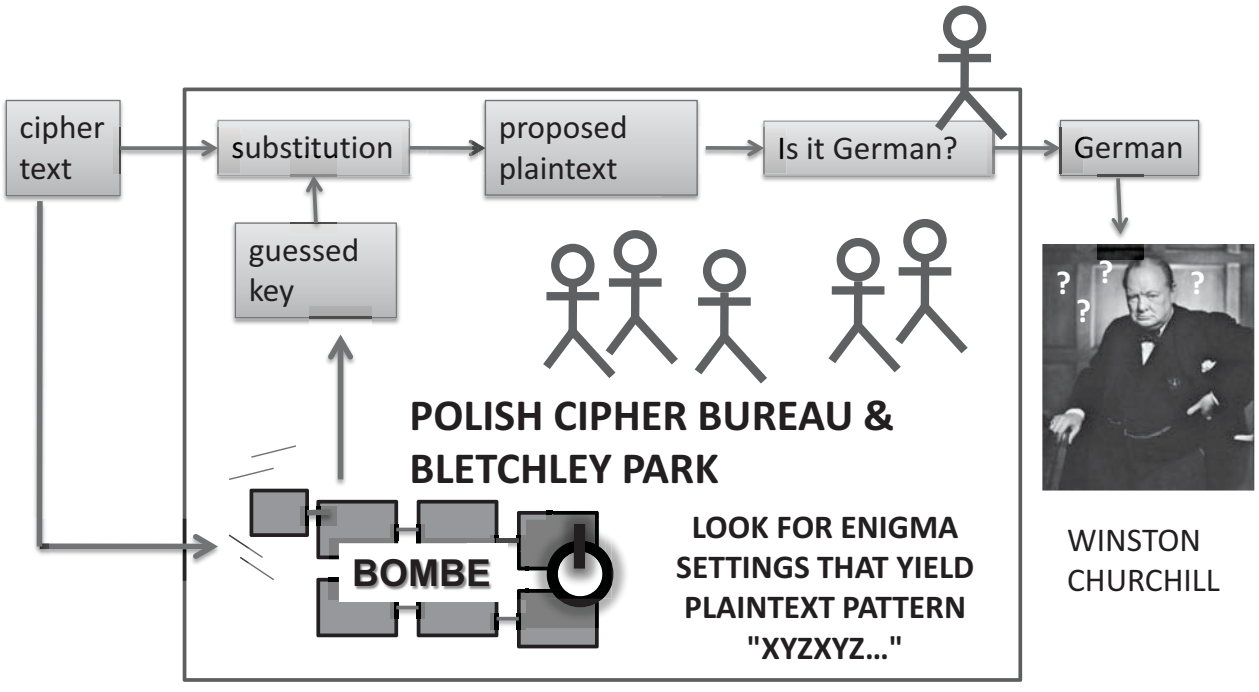
NNN → JTE

Rotates through 1000s of substitution keys.

Reversible behavior

NNN → JTE → NNN

Breaking Enigma



Enigma

- Mathematical breakthroughs:
  - Log-odds for weight of evidence [Good, Turing]
  - Smoothing with prior [Good, Turing]
  - Information theory [Shannon]

elegant, powerful, widely-applicable mathematics

- 1945: War ends
- 1973: Wartime Enigma decipherment leaked
- 1975: Last surplus Enigma given to developing countries
- 1996: One Turing Enigma treatise declassified
- 2012: Another declassified (but have to go to England)

Turing Enigma Treatise

(aka NR 964, Box 201, RG 457, aka "The Prof's Book")

140pp (written sometime between 1939 and 1942)

One method is to try independently all the possible positions for the middle wheel. We shall want to know the middle wheel couplings which are consequences of these various assumptions. This can be c inverse rods for the middle wheel. The rods are paired off R.H.W. couplings, i.e. M.W. output. This has been done for fx, ep which arose in the DANZIGVON crib in Fig 55, assun in the middle. The pairs in each column of this set up give possible M.W. couplings. We have now to find out whether these coupli Our procedure is rather different according as the U.K.W. rotate. In the case that the U.K.W. does not rotate it will b a Foss sheet (the rows and columns lettered preferably with the diagonal alphabet) in which, in the RW square are entered the positions of the left hand wheel at which the RW is one of the pairs in the L.H.W. output alphabet Fig 51. This is known as the 'short catalogue' for this wheel.

~~elegant,~~ powerful, war-winning ~~widely-applicable~~ mathematics

if we worked this hard on machine translation ...

Foreign language as a code

Alan Turing, on Thinking Machines

Instead we propose to try and see what can be done with a 'brain' which is more or less without a body, providing at most, organs of sight speech and hearing. We are then faced with the problem of finding suitable branches of thought for the machine to exercise its powers in. The following fields appear to me to have advantages:-

(i) Various games e.g. chess, noughts and crosses, bridge, poker.

(ii) The learning of languages.

(iii) Translation of languages.

(iv) Cryptography.

(v) Mathematics.

Of these (i), (iv), and to a lesser extent (iii) and (v) are good in that they require little contact with the outside world. For instance in order that the machine should be able to play chess its only organs need be 'eyes' capable of distinguishing the various positions on a specially made board, and means for announcing its own moves. Mathematics should preferably be restricted to branches where diagrams are not much used. Of the above possible fields the learning of languages would be the most impressive, since it is the most human of these activities. This field seems however to depend rather too much on sense organs and locomotion to be feasible.

The field of cryptography will perhaps be the most rewarding. There is a remarkably close parallel between the problems of the physicist and those of the cryptographer. The system on which a message is enciphered corresponds to the laws of the universe, the intercepted messages to the evidence available, the keys for a day or a message to important constants which have to be determined. The correspondence is very close, but the subject matter of cryptography is very easily dealt with by discrete machinery, physics not so easily.

Statistical Machine Translation

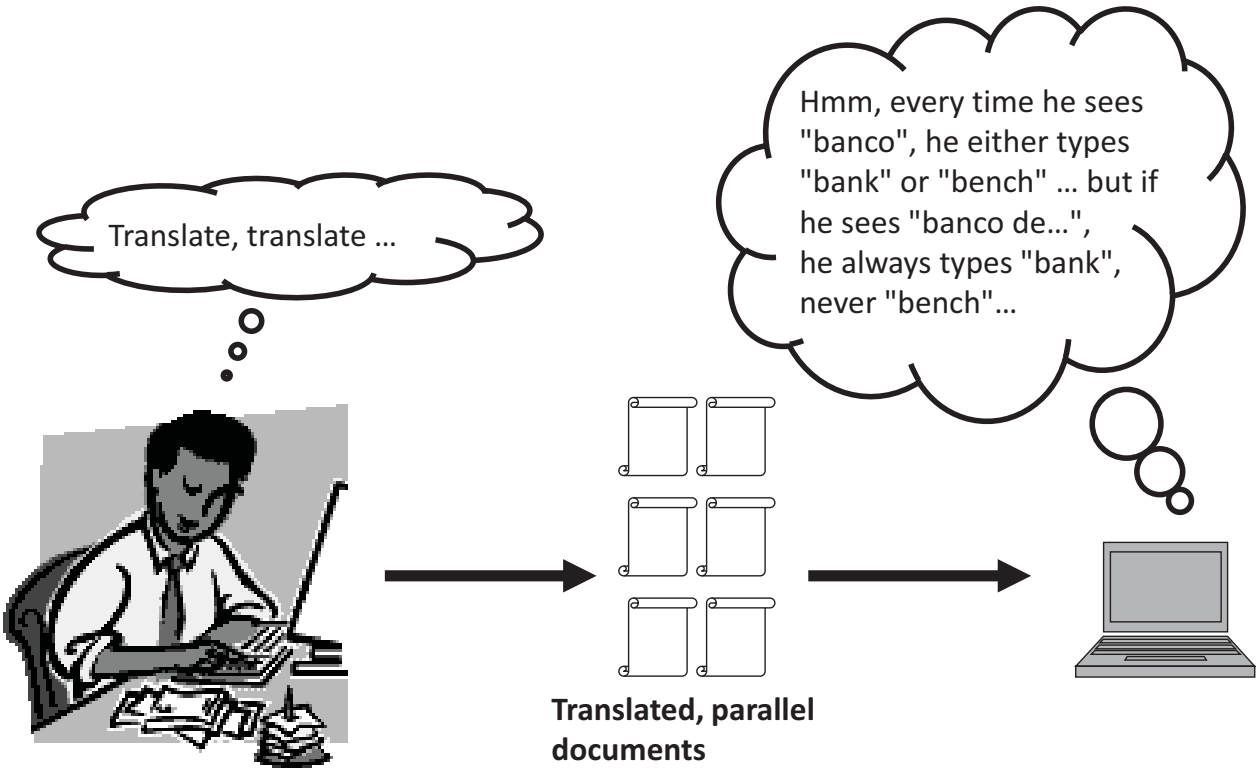
"When I look at an article in Russian, I say: this is really written in English, but it has been coded in some strange symbols. I will now proceed to decode." -- Warren Weaver (1947)

OUR HERO

Weaver saw a colleague decoding intercepts into Turkish, without "knowing" Turkish.

… maybe a computer could translate into English without "knowing" English?

Statistical Machine Translation



Parallel Corpus

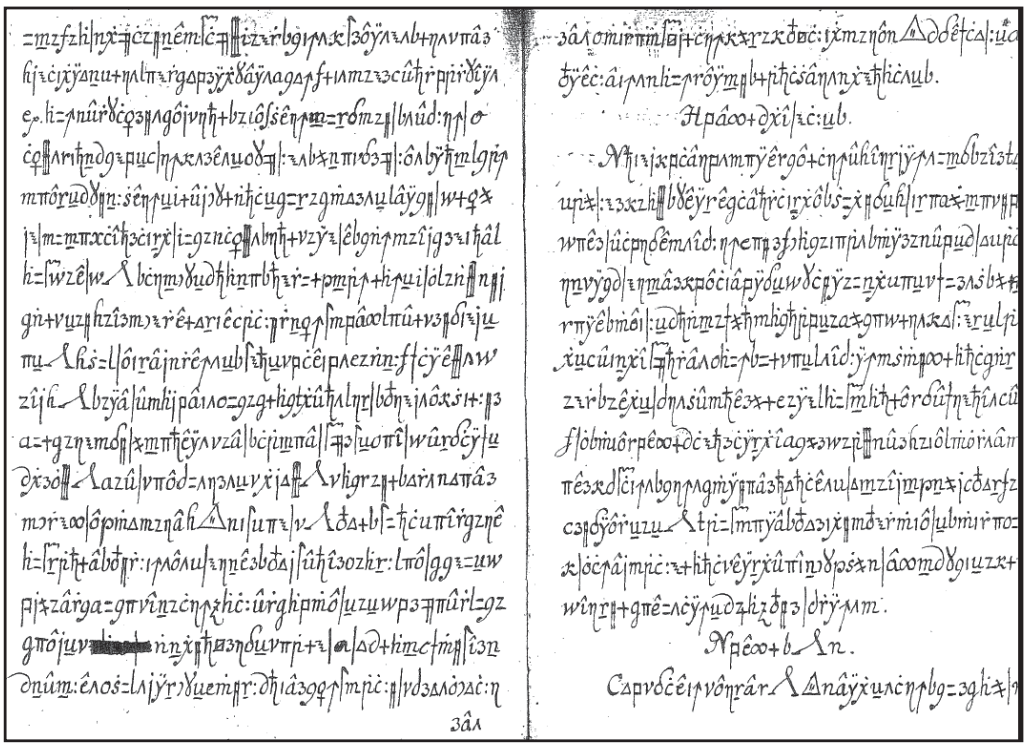
ACTUAL CURVES

[Ravi & Knight 08]

Some Recent Historical Decipherments

- Jefferson cipher (L. Smithline)
  - http://online.wsj.com/article/SB124648494429082661.html
  - For more than 200 years, buried deep within Thomas Jefferson's correspondence and papers, there lay a mysterious cipher -- a coded message that appears to have remained unsolved. Until now.
- Civil War ciphers (K. Boklan)
  - Cryptologia, 30:340–345
  - We study a previously undeciphered Civil War cryptogram, limiting ourselves to pencil and paper, and discover not only a missive of military importance, but in the process identify a new Confederate codeword. Our methods rely not only upon cryptanalysis of the encryption method but also on the exploitation of an elementary mistake.
- German Naval Enigma
  - http://www.enigma.hoerenberg.com
  - The "Breaking German Navy Ciphers" Project was founded in 2012. The goal is to break original radio messages, which were encoded with the famous German ENIGMA cipher machine. Up to now, we've succeeded in deciphering 53 original World War II Enigma M4 messages. Many of these messages had never been broken before, so you can read them for the first time in history.

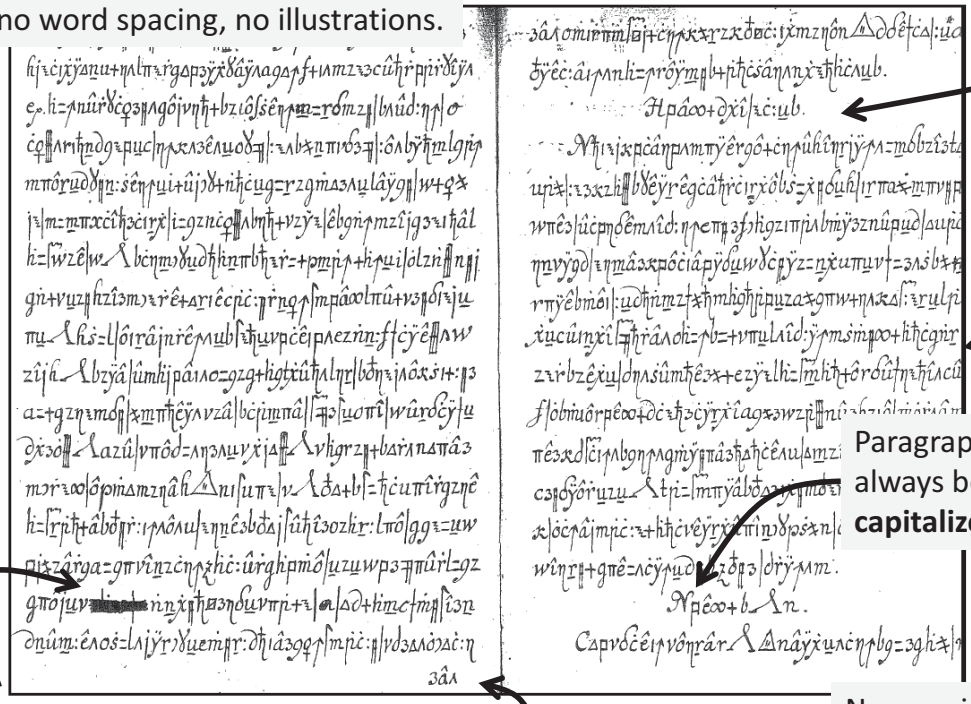
Copiale Cipher



[Knight, Megyesi, Schaefer 11]

Copiale Cipher

105 pages, 75000 letter tokens, no word spacing, no illustrations.



Section headers

Lines ≈ equal length

Paragraphs and section titles always begin with **capitalized Roman letters**.

Non-enciphered inscriptions: **Copiales 3** and **Philipp 1866**

Some scratch-outs, rare

Homophonic Cipher

Result of computer attack on Copiale, using 80 possible plaintext languages?

FAIL

But, slight numerical preference for German

Cipher Characteristics

digraphs:		trigraphs:	
ɔ ɬ	99	ɔ ɬ ʌ	47
ċ :	66	ċ : u̲	23
ɬ ʌ	49	ɳ ɔ ɬ	22
: u̲	48	ÿ ɔ ɬ	18
z ß	44	ɦ ċ |	17

tendencies:

â, ê, î, ô, û followed by ȝ and ¡

â, ê, î, ô, û preceded by z and π

↓ ? ↓ ?

should appear adjacent in German text

Make full digraph table for cipher and for German

Key Observation #1

In Copiale, ɔ almost always followed by ɬ

In German, C almost always followed by H

(German CH is like English QU)

So guess: ɔ = C, ɬ = H

One Thing Leads to Another

ɔħ = CH → ɔħʌ = CHT → ʌ = T ?

Each step is guesswork.

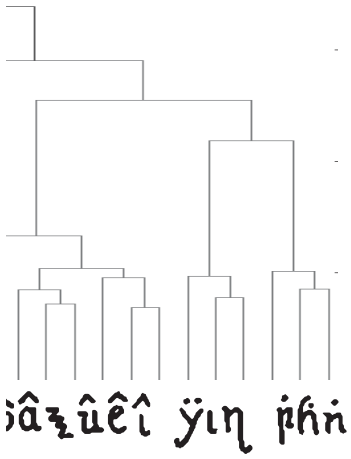
Must be willing to retract.

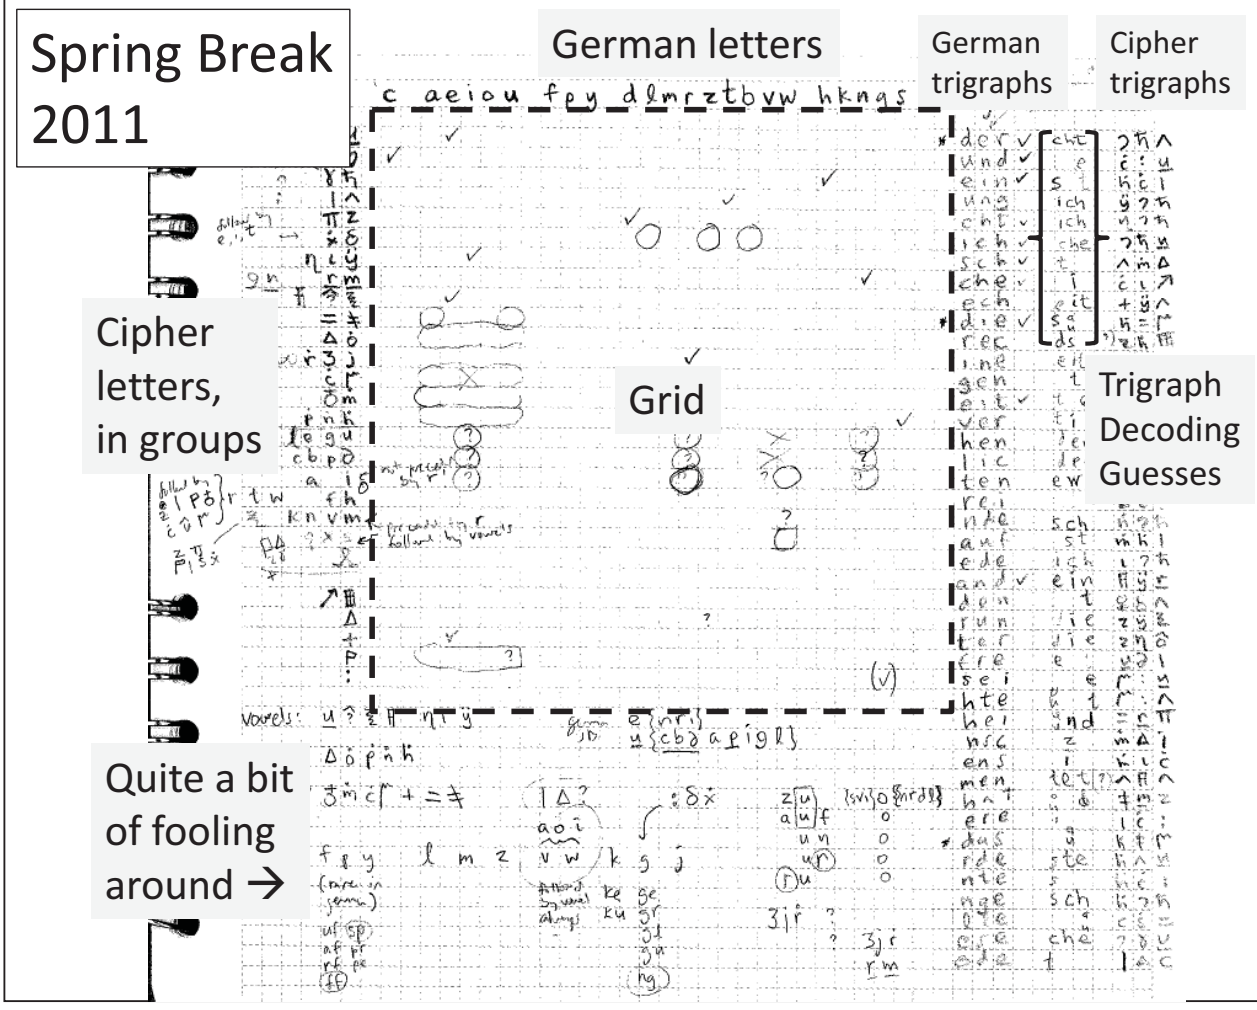
Weird task, not knowing German.

No longer care what the book says.

Cluster diagram crucial:

ÿ = I → ɪ = I , ɳ = I

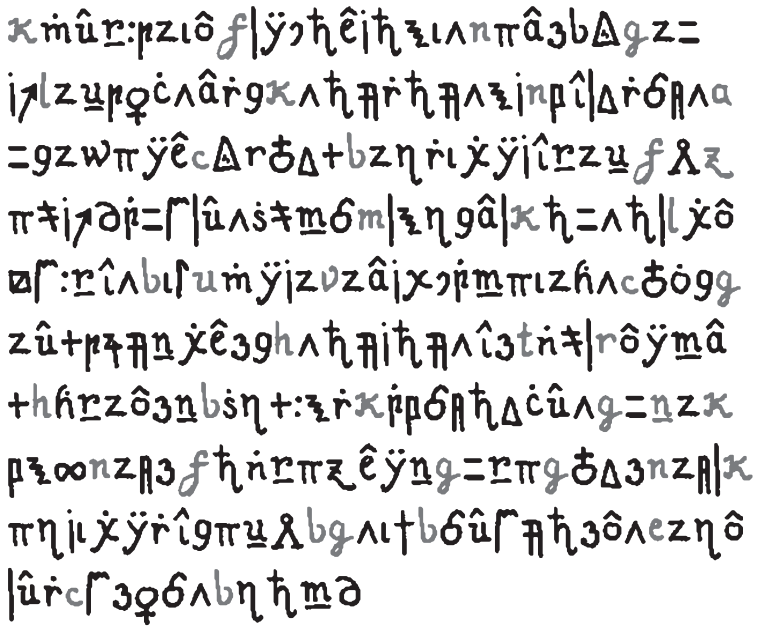




Key Observation #2

unaccented Roman letters that cluster:

a	b	c	d	e	f	g	h	i
k	l	m	n	o	p	q	r	s
t	u	v	w	x	y	z		



Actually, those are space bars

[Knight et al 06]

Word Substitution (Giga-scale)

- Suppose I replace each English word on your hard drive with some integer.
- Can you recover your texts?
- In principle, apply the same techniques we used for letter substitution.
  - English word-bigram LM drives decipherment
  - But for EM, initially-uniform substitution table is too big!
  - 100,000 x 100,000

Word Substitution (Giga-scale)

- Gibbs sampling fixes memory problem

```
Cipher:     24234   1899    39902    5716    29948 ...

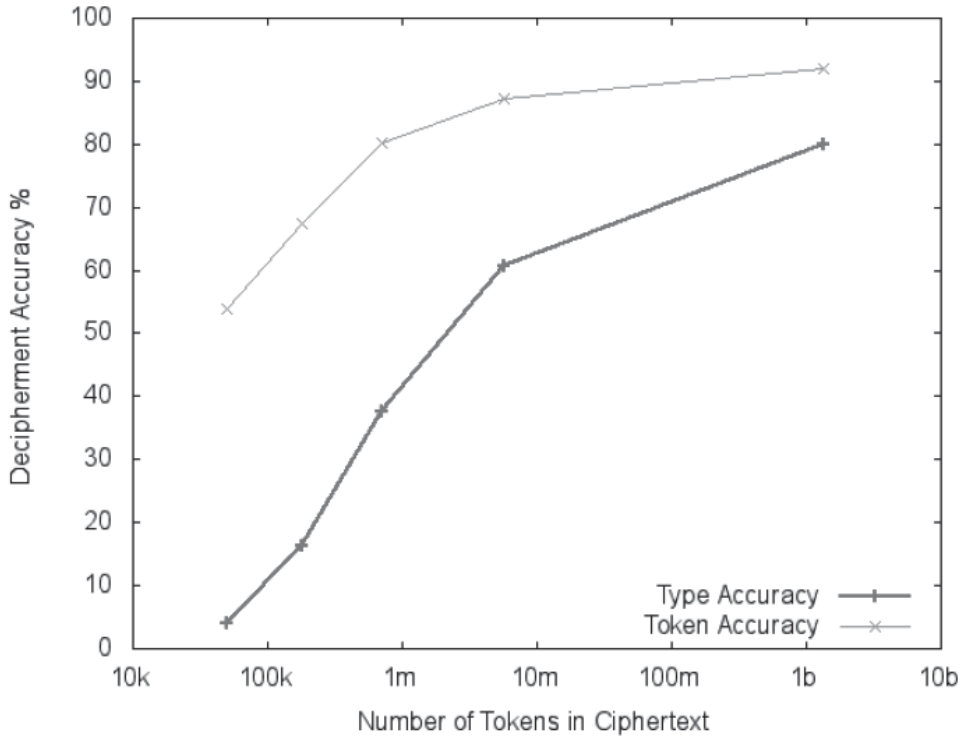
Plain:        the     man       is     car      are ...

Resample:             a
                     an
                  apple
                    ...
                    man
                    zoo
```

Still need to sample 100,000 alternatives at each cipher token, for each epoch.

- Slice sampling (Dou & Knight 12) fixes speed problem

Word Substitution (Giga-scale)

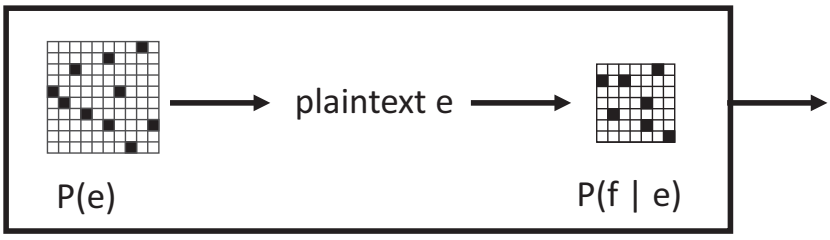


(Dou & Knight 2011)

Foreign Language as a Cipher

"When I look at **this giant corpus of Arabic**, I say to myself, this is really English, but it has been encoded in some strange symbols!!! Let's decode!!!"

OUR HERO



رفض رئيس السلطة الفلسطينية محمود عباس مجددا تصريحات وزير الخارجية الإسرائيلي سيلفان شالوم التي قال فيها إنه يتعين على إسرائيل إعادة النظر في انسحابها من غزة، المقرر أن يتم الصيف المقبل إذا فازت حركة المقاومة الإسلامية حماس في الانتخابات التشريعية.
وقال عباس في مؤتمر صحفي على هامش مشاركته في القمة العربية-اللاتينية الأولى إنه يتعين على إسرائيل احترام خيار الشعب الفلسطيني حتى لو فازت حماس بالانتخابات، وأضاف "إذا نجحت حماس أو فتح سيكون هذا خيار الشعب الفلسطيني، وعلى الجميع قبول هذا الخيار بكل ترحاب".
من جانبه شجب رئيس الحكومة الفلسطينية أحمد قريع الطابع الأحادي الجانب للانسحاب الإسرائيلي من غزة، وأكد أن إسرائيل تريد مغادرة هذه الأراضي لتعزيز سيطرتها على الضفة الغربية.
وقال قريع في كلمة له خلال مؤتمر نظمته وزارة الأوقاف في رام الله "سينسحبون من غزة ولكننا لا نعرف ما هو شكل هذا الانسحاب وماذا سيتركون، وما هو مصير المعابر والحدود, وكل ذلك غامض لأنه قرار أحادي الجان

Foreign Language as a Cipher

BAGHDAD, Iraq (CNN) -- Six bombings killed at least 54 Iraqis and wounded 96 others Wednesday, including 20 civilians who died as they lined up to join the Iraqi army in Hawija when a suicide bomber detonated explosives hidden under his clothing, Iraqi officials said.
That attack in the town about 130 miles (209 kilometers) north of Baghdad also wounded 30 Iraqis, said Iraqi army Lt. Col. Khalil al-Zawbai.
A car bombing in Saddam Hussein's ancestral homeland of Tikrit also killed 30 Iraqis and wounded another 40, Iraqi officials said. The Tikrit explosion…

Key Point: These texts are not related to each other.

History of Voynich Manuscript (VMS)

1576-1612 Rudolf II purchases VMS

1608-1622 J. de Tepenecz signs VMS in Bohemian court

1630s George Baresch owns VMS sends letter to Kircher

1639 GB writes Kircher again

16xx Marci inherits VMS from GB

1665 Marci sends VMS to Kircher with letter

1665-80 Kircher owns VMS

1680 Kircher dies

1864 Ethel Boole born in England
1865 WV born in Lithuania
1885 WV imprisoned, Polish nationalist
1890 WV & EB meet, marry in 1902
1898 WV publishes first book list
1912 WV acquires VMS in "ancient castle"
1914 WV moves to USA, opens bookshop
1919 WV sends photostatic copies of VMS
1919 Copying reveals de Tepenecz signature
1919 WV writes to Bohemian State Archvs
1921 WV presents VMS + inserted Marci letter mentioning Francis Bacon, asks $160k
1921 Newbold & WV announce decipherment
1930 WV dies. VMS placed in vault, $100k
1931 VMS appraised at $19,400
1960 Ethel dies, VMS to secretary Ann Nill "Castle" revealed as Villa Mondragone
1961 NY dealer Hans Kraus buys for $24,500
1969 Kraus donates VMS to Yale
1972 Brumbaugh finds WV letters in BSA
200x Zandbergen finds 1639 Baresch letter in newly online Kircher archive

Newbold Decipherment

22x22 table

Encoding:
A → CC, OM, …
B → …
…
N → HA, MI, DO, NU …
…
Z → …

Decoding:
…
DO → N
…

Encoder has freedom to devise a "cover text" to hide real message.

Example:
a n n … → DO MI NU … → DOMINU …

Newbold System

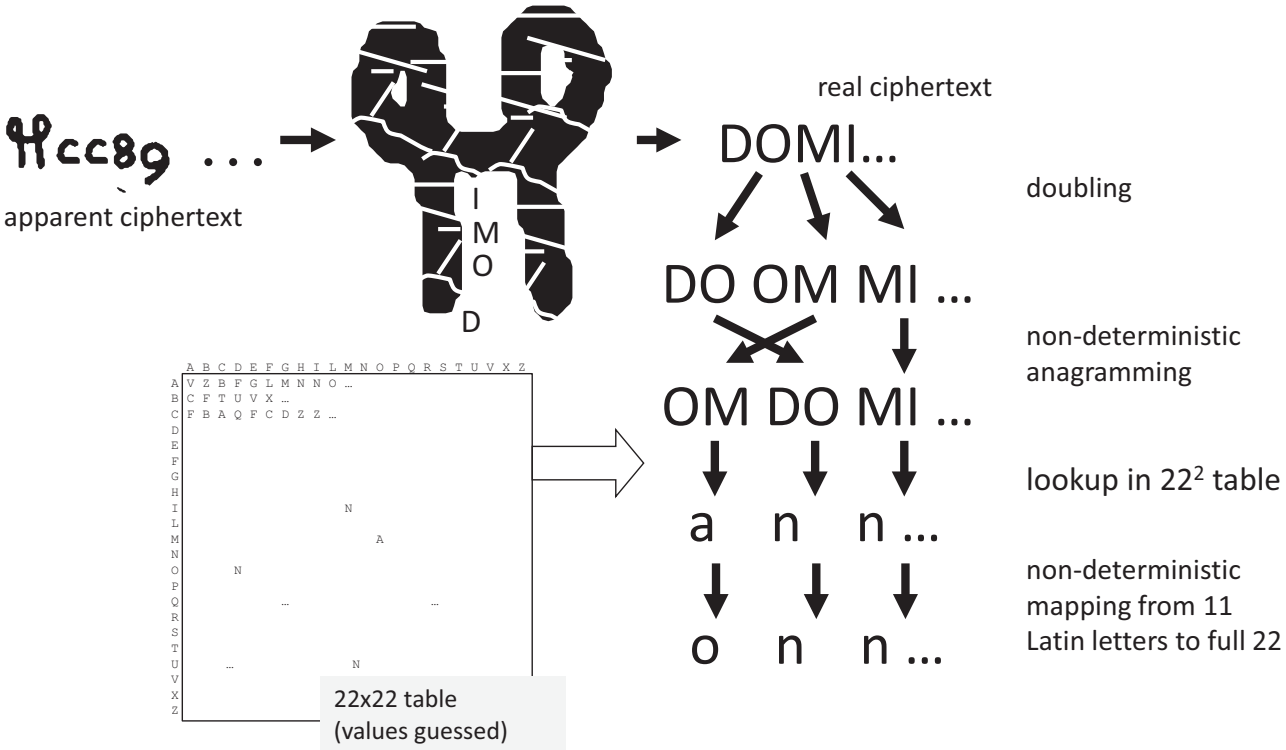
- Too hard to assemble good "cover" text!
- **So, make cipher letter-pairs overlap:**
  a n n … → AD DB BR … → ADBR …
- **Then, employ anagramming:**
  a n n … → OM DO MI … → DO OM MI … → DOMI …
- Now can construct a plausible looking "cover" text in Latin for our secret message (also in Latin)
- An ingenious system, to be sure!

Newbold Decipherment

Hmm, by the method, both plaintext **and ciphertext** should be in Latin letters…

But the VMS doesn't have Latin letters…

Let's Decipher with Newbold !



Newbold's Results

1300 real ciphertext "letters" in first 3 lines

Decipherment of those first lines:
"I, Roger Bacon, have written this…"
(in Latin)

Anagramming sets of 55 letters is sometimes required.

Slow but steady progress… Andromeda galaxy, ovaries … so … Roger Bacon must have had a microscope & telescope, hundreds of years before they were invented … !

An Application of PTAH to the Voynich Manuscript (U)

BY MARY E. D'IMPERIO

~~Top Secret Umbra~~

(U) This article is the second in a series of studies applying some modern statistical techniques to the problems posed by the Voynich manuscript. This study attempts to discover and demonstrate regularities of patterning in the Voynich text subjectively noted by many earlier students of the manuscript. Three separate PTAH studies are described, attacking the Voynich text at three levels: single symbols, whole "words," and a carefully chosen set of substrings within "words." These analyses are applied to samples of text from the "Biological B" section of the manuscript, in Currier's transcription. A brief general characterization of PTAH is provided, with an explanation of how it is used in the present application.

s a general
Analyses),
aper in the
mmer. Mr.
king on his
program. He was struck by the passage "immenso Ptah noi invociam," and named his program after the Egyptian god. The name was ultimately extended from this program, implementing a particular application of the method, to the method and its mathematical theory as well [2, p 85]. According to [redacted] of R51, the name is pronounced "however you like" [8]. The technique itself and its uses are classified Top Secret Codeword.

[redacted]

I chose PTAH for the present study for two main reasons: first, because of the applications of PTAH to book codes, and second, because I wished to learn more about PTAH itself [redacted]

CRYPTOLOG

NSA newsletter declassified in 2013.

4400 pages (1974-1997).
238 Mbyte PDF file.

Covers intelligence gathering, linguistics, military, cryptography, office space, pay grades, human factors, etc.

Heavily redacted.

CRYPTOLOG: Voynich

DOCID: 4009723 UNCLASSIFIED

The Voynich Manuscript

When a newspaper editor needs a filler, he can always fall back on the Loch Ness Monster or the Abominable Snowman. For the editor of a cryptologic magazine the obvious device is another blurb on the subject here discussed. So, evidently, thought a former editor, among whose effects the following paragraphs were found.

Is the Voynich manuscript "real"? No. Is it a hoax? No. What is it, then? A make-believe--an elaborate fantasy produced purely for the satisfaction of the maker.

That was my reaction the first time I looked at it closely, but faced with all the profound theories about it I lacked the courage to say so. However, a recent rereading of Elizabeth Friedman's article in the Washington Post (August 5, 1962) and of Brigadier Tiltman's paper in the NSA Technical Journal (Summer 1967), plus some phenomena I have seen in the meantime, have emboldened me to give the world the benefit of my thoughts.

~~(FOUO)~~ An example of all of these problems is the Voynich manuscript, a unique European manuscript thought to date most probably from the 15th or 16th century, which has resisted solution, not only by philologists early in this century, but by NSA cryptanalysts as well.

The Voynich Manuscript Revisited

P16

The Voynich Manuscript, an object of interest off and on since the seventeenth century, contains over 200 pages written in a partially cursive alphabet which has proved indecipherable. Equally enigmatic are the large number of drawings -- of plants, few of which are identifiable, and of naked women sitting in tubs or emerging from pipes (one writer has called the latter a "plumber's nightmare").

The history of the manuscript, which has been detailed in other places, needs only passing mention since it does not throw any light on the content. Dating from about 1500, it was said by Joannes Marci, mathematician and orientalist at the University of Prague, to have belonged at one time to Emperor Rudolf II (1576-1612). Marci writes in 1666 to the Jesuit Athanasius Kircher, in Rome, that he was making a present to the latter of the manuscript, the author of which, he had heard from another source, was the great medieval scholar Roger Bacon. (How Marci came into possession of it, I do not know.)

Marci himself withheld judgment on the attribution, but at least one scholar since his time became intrigued with the notion of Baconian authorship. Professor William Newbold of the University of Pennsylvania was convinced that it was an enciphered text prepared by Bacon and he worked on this assumption from 1919 until his death in 1926. He thought he had deciphered some of it, including an occurrence of "R. Baconi" on the last page[1]. His "solution" has been convincingly refuted by other scholars, who however have not offered anything better.

I now rush in where angels fear to tread. Although not a specialist in Old Norse, I am convinced that the manuscript is a text in fifteenth century Danish or Norwegian -- not a cipher, and not an artificial language, as has also been suggested. For reasons too complex to go into here, I have tentatively ruled out Old East Norse (that is, Old Swedish) and rejected altogether the second branch of Old West Norse, Old Icelandic. The reasoning which suggested Dano-Norwegian is given below.

Most of the manuscript has a depressing number of repeated words and phrases, of little help unless collateral information is available, suggesting that these are prayers, incantations, or formulas of a specific character. This is

[1]The information in this paragraph and the preceding paragraph was taken from *Horizon*, January 1963 (Vol. V, No. 3).

CRYPTOLOG: Machine Translation

is machine translation. Machine translation is actually having a computer prepare a translation. There was to have been no difference in quality or style between a translation done by a machine and one done by a person. Georgetown University was very active in the field for some time. Progress wasn't as easy and rapid as had been anticipated, however, and in 1966 the Automatic Language Processing Advisory Committee published a report recommending that research along machine-translation lines be cut back. This report sharply curtailed federal funding. There is still, however, research being done both here and abroad, and there are several machine-translation systems that claim to be operational. One is the METEO project in Canada, which developed a system that translates weather reports from English into French. CULT (Chinese University Language Translator) in Hong Kong translates two periodicals into English. And a system was developed by a U.S. company for FTD and was adapted for use by NASA during the Apollo-Soyuz Test Project. These systems differ a great deal in their approach and in the amount of pre-editing and postediting that is necessary, but all are true machine-translation efforts.

At present, NSA has a rather limited machine-translation effort.

As machine translation stands today, we haven't reached the stage where we can feed a "source" (foreign-language) text into a computer and produce a text in the "target" (in our case, English) language which is as good as the human product, not without extensive pre-editing or postediting. But in the science and technology world, current machine translation has a place. Some scientists prefer it to the

and
P16

P.L. 86-36

Partial Machine Translation (PMT) is a word-for-word or phrase-by-phrase "translation" from one language to another. The quotations marks are placed around the word "translation" to show that a PMT is not exactly what most people consider a true (or full) translation, but the quotes are inserted reluctantly. Although it may be difficult to read the

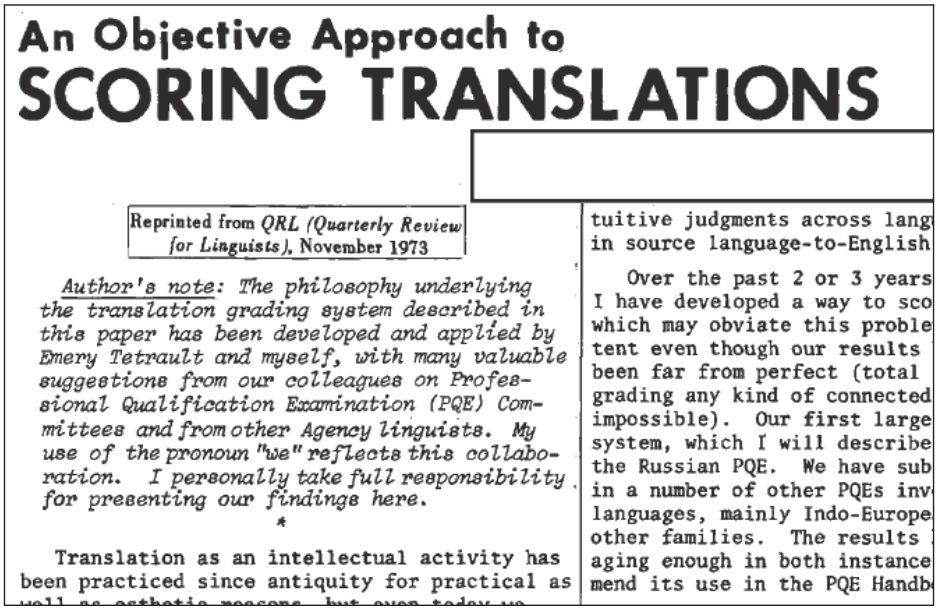
CRYPTOLOG: Evaluating Translations



An Objective Approach to SCORING TRANSLATIONS

Reprinted from *QRL (Quarterly Review for Linguists)*, November 1973

Author's note: The philosophy underlying the translation grading system described in this paper has been developed and applied by Emery Tetrault and myself, with many valuable suggestions from our colleagues on Professional Qualification Examination (PQE) Committees and from other Agency linguists. My use of the pronoun "we" reflects this collaboration. I personally take full responsibility for presenting our findings here.

Does VMS Have Content Words?

Measure the saliency of a word in a page with TF-IDF

$$\text{TF-IDF}(w, d) = \text{TF}(w, d) \times \log \frac{N}{\text{DF}(w)}$$

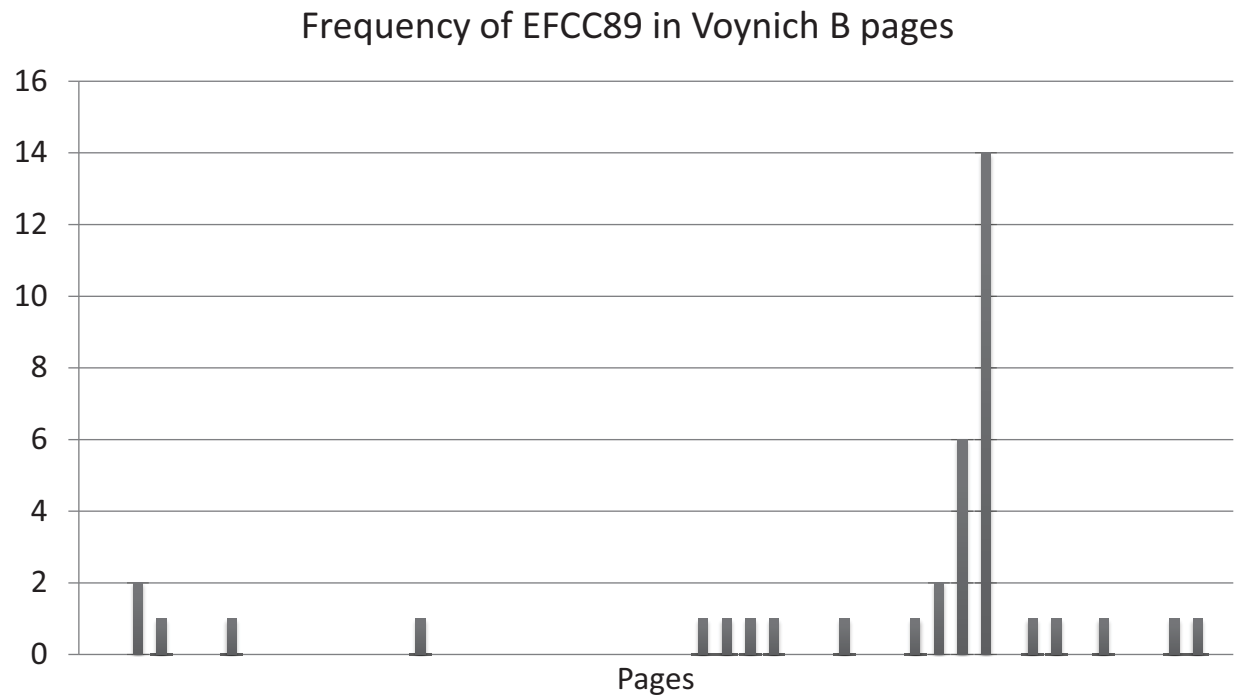
times that word *w* occurs in page *d*

pages that contain word *w*

(Reddy & Knight, 2011)

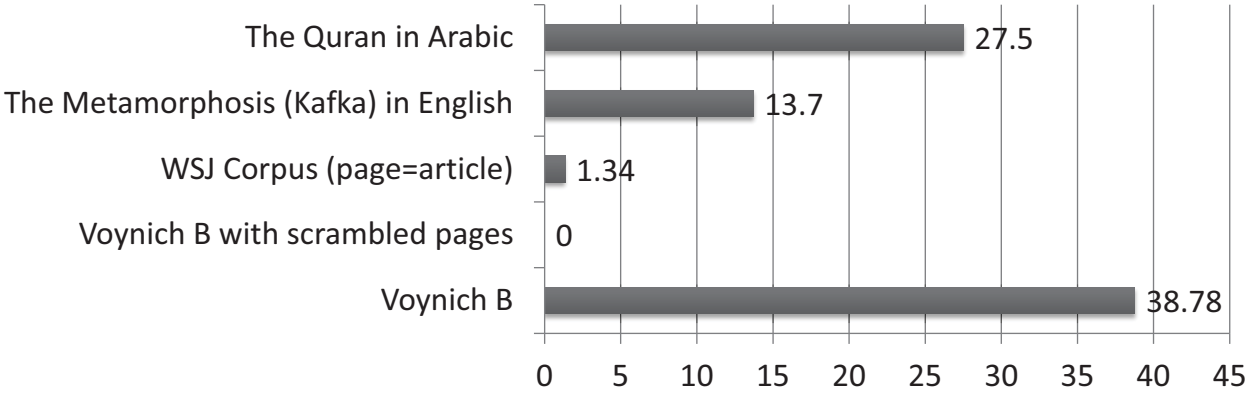
Does VMS Have Content Words?

Do Content Words Indicate Topics?



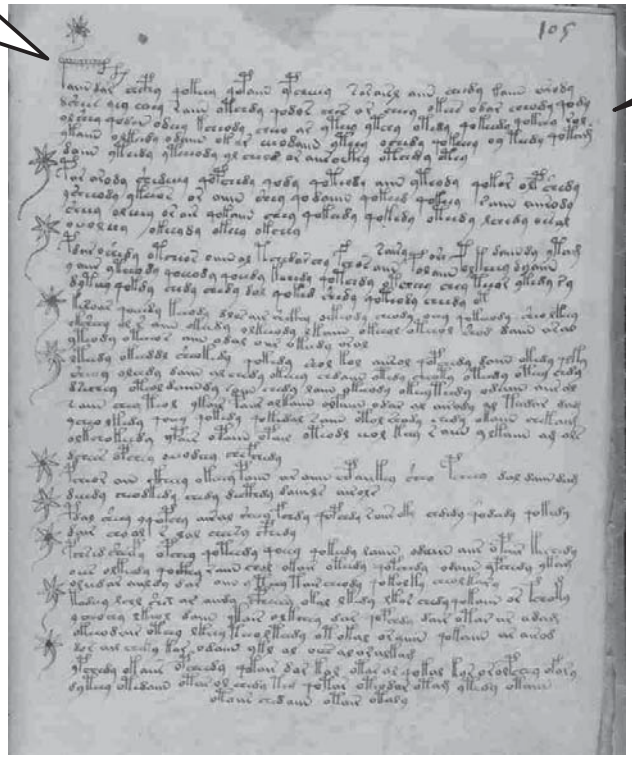
Are VMS Pages in Order?

- Measure similarity between a pair of pages using cosine similarity (with bag-of-words)
- Count the % of pages *P* where the most similar page to *P* is adjacent to it



Is VMS Prose?

Special ligatures at beginning of "paragraphs"



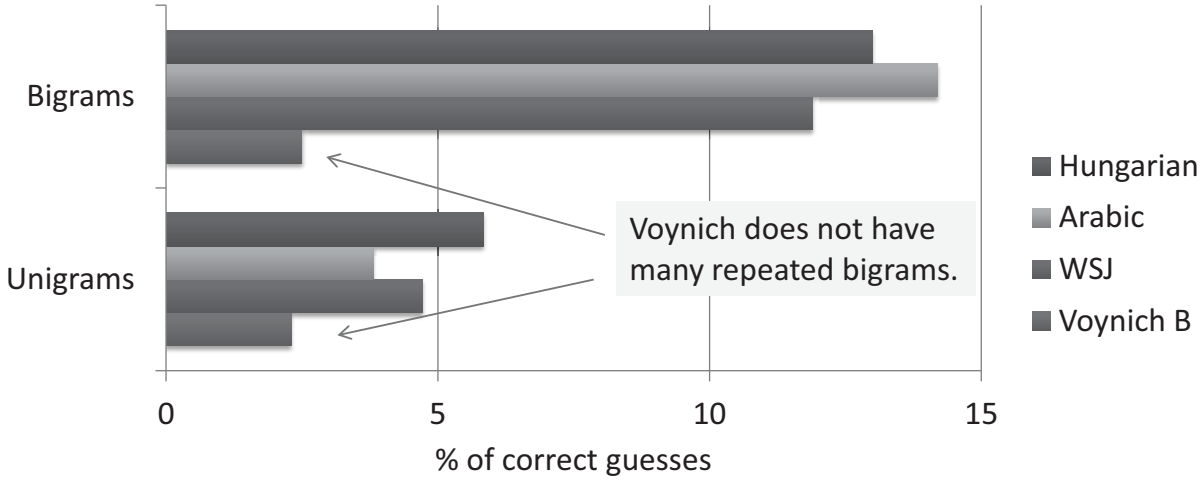
Looks like paragraph structure

BUT:
Lines begin and end disproportionately often with certain characters!

The line is a functional entity…

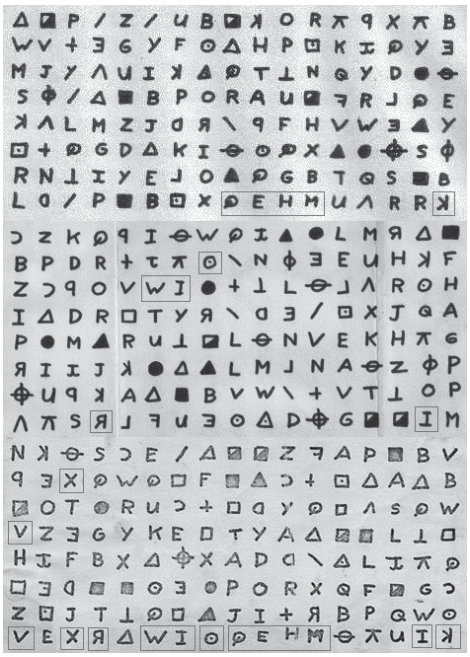
Are VMS Word Sequences Predictable?

- Guess most likely word to follow current word
- Simulate game from bigram probabilities
  90-10 train-test splits

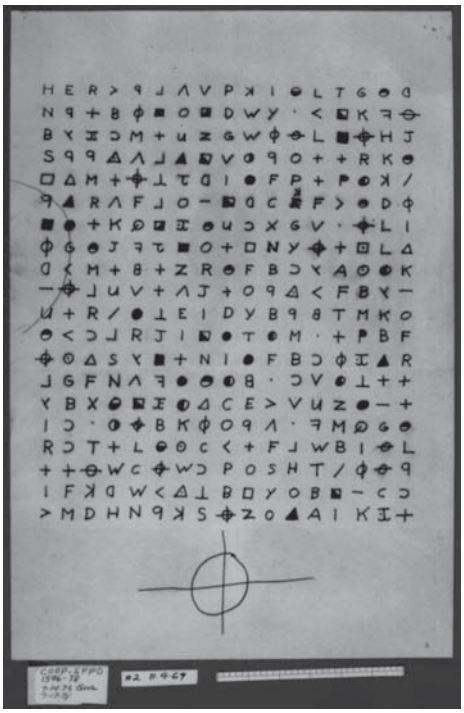


Zodiac Killer Ciphers

Zodiac 408 (solved, 1969)

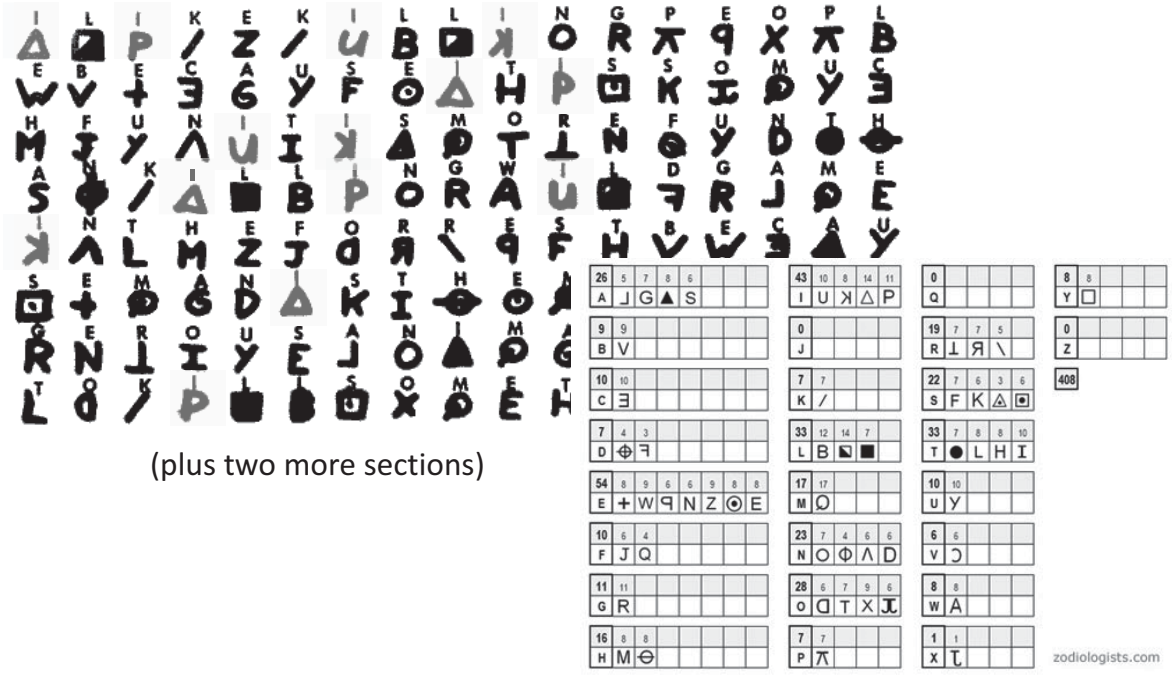


Zodiac 340 (still unsolved)



Zodiac Serial Killer

408-letter cipher (solved):



(plus two more sections)

Zodiac Serial Killer

Plaintext solution

> I LIKE KILLING PEOPLE BECAUSE IT IS SO MUCH FUN IT IS MORE FUN THAN KILLING WILD GAME IN THE FORREST BECAUSE MAN IS THE MOST DANGEROUE ANAMAL OF ALL TO KILL SOMETHING GIVES ME THE MOST THRILLING EXPERENCE IT IS EVEN BETTER THAN GETTING YOUR ROCKS OFF WITH A GIRL THE BEST PART OF IT IS THAE WHEN I DIE I WILL BE REBORN IN PARADICE AND THEI HAVE KILLED WILL BECOME MY SLAVES I WILL NOT GIVE YOU MY NAME BECAUSE YOU WILL TRY TO SLOI DOWN OR ATOP MY COLLECTIOG OF SLAVES FOR MY AFTERLIFE EBEORIETEMETHHPITI

Plaintext has many misspellings

Final 18 plaintext characters of 408 are "junk"

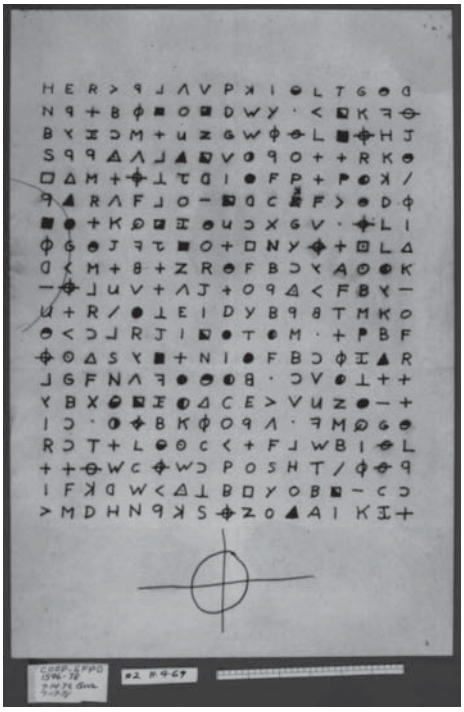
Deciphering Zodiac 408
Bayesian models & Gibbs sampling

Language Model	Initial Sample	Decipherment Error
3-gram	Random	62.3
5-gram	Random	all wrong!
"	3-gram solution	42.6
Word 1-gram	Random	all wrong!
Interpolated 5-gram and word 1-gram	Random	79.2
"	5-gram solution	**3.3 / 2.6**

[Ravi & Knight 11]

See also Malte Nuhn's paper at ACL 2013!

Unsolved Zodiac 340



Has no obvious reading order bias:

% cipher bigram types that repeat (freq > 1)	Left/ Right order	Up/ Down order	Diag. North-East	Diag. South-East
Zodiac 408 (solved)	13 %	5	7	5
Zodiac 340 (unsolved)	7	6	8	5

Could be nonsense … or maybe bigrams are smoothed out via more careful substitutions.

What if Spoken Language Behind Script is Unknown?

- Build a universal model P(p) of human phoneme sequence production
  - human might generally say: K AH N AH R IY
  - human won't generally say: R T R K L K
- Find a P(c | p) table
  - such that there is a decoding with a good universal P(p) score

- Phoneme & syllable inventory
  - if z, then s
  - all have CV syllables; if VCC, then also VC
- Syllable sonority structure
  - dram, lomp, ? rdam, ? lopm
- Physiological preference constraints
  - tomp, tont, ? tomk, ? tonp
